## Micro-Fibre Wallcoverings (Care & Maintenance Advice)

Micro-fiber wallcovering enables fine optical effect fibres to be laminated onto a stabilized PVC surface with the effect that an attractive translucent ambience is created which simulates Oriental silks and a hint of metallic sheen.

This “natural” look is quite deliberate and means, as with other natural products that greater day-to-day care needs to be taken.

It is therefore important to remember the following points: -

- 1 Under no circumstances should abrasives, acids or active solvents be used when cleaning the surface of a micro-fibre wallcovering.
- 2 In the event of soil or dust marks appearing a light sponge rinsed in clean warm water and a mild soap should be *gently* wiped down the affected part of the wallcovering, ensuring there is no undue pressure applied that might damage the surface tone.
- 3 Marks or stains involving paint or certain inks from biros or pens should be avoided if possible and will need to be assessed carefully before any cleaning takes place as many of these may be oil-based and therefore not removable by using warm water and soap. In these cases and if the ink or paint stains are widespread, the only practical solution may be the replacement of the wallcovering in the affected area. (Solvent cleaners may be effective in removing paint or inks but may also damage the colour and tone of the micro-fibre surface).
